ECO553: International Macroeconomics and Finance Course overview Our International Economics MSc looks at economic interactions between countries, focused on international trade and finance. It also provides a solid basis in the use of analytic and quantitative methods in examining economic issues.

This short, concrete, and to-the-point book guides students through this vast field of conflicting opinions. The book begins from the premise that students benefit most from seeing a balanced treatment of all available views. For instance, this book provides coverage of both ad hoc and optimizing models. It also explores divisions such as flexible price versus sticky price models, rationality versus irrationality, and calibration versus statistical inference. By giving consideration to each of these 'mini debates', this book shows how each approach has its good and bad points.

An innovative text that offers the first integrative modern treatment of the core issues in open economy macroeconomics and finance.

Most theories in economics and finance predict what people will do, given what they know about the world around them. But what do people know about their environments? The study of information choice seeks to answer this question, explaining why economic players know what they know--and how the information they have affects collective outcomes. Instead of assuming what people do or don't know, information choice asks what people would choose to know. Then it predicts what, given that information, they would choose to do. In this textbook, Laura Veldkamp introduces graduate students in economics and finance to this important new research. The book illustrates how information choice is used to answer questions in monetary economics, portfolio choice theory, business cycle theory, international finance, asset pricing, and other areas. It shows how to build and test applied theory models with information frictions. And it covers recent work on topics such as rational inattention, information markets, and strategic games with heterogeneous information. Illustrates how information choice is used to answer questions in monetary economics, portfolio choice theory, business cycle theory, international finance, asset pricing, and other areas Teaches how to build and test applied theory models with information frictions Covers recent research on topics such as rational inattention, information markets, and strategic games with heterogeneous information

This book provides a non-mathematical introduction to the macroeconomic analysis of both the open economy and the world economy. While it presumes some basic understanding of macroeconomics, it does not require any significant mathematical capability. The first part examines the macro theory of the open economy; the second part examines macroeconomic stabilisation policy in the context of an open economy, and the world economy; and the third part looks at various case-studies or applications of the analysis introduced in the first two parts. This has been radically rewritten to accommodate recent global economic events, and demonstrates how the theoretical discussion goes a long way to explain recent changes in the world economy. Each chapter is accompanied by some brief notes and additional references but the intention has been to keep the book short and manageable. The practical orientation of the book ensures that it will be of interest to policy-makers, but it is also suitable for first- or second-year undergraduates, either as a course text or as a supplement to other more conventional macroeconomics textbooks.

This book collects selected articles addressing several currently debated issues in the field of international macroeconomics. They focus on the role of the central banks in the debate on how to come to terms with the long-term decline in productivity growth, insufficient aggregate demand, high economic uncertainty and growing inequalities following the global financial crisis. Central banks are of considerable importance in this debate since understanding the sluggishness of the recovery process as well as its implications for the natural interest rate are key to assessing output gaps and the monetary policy stance. The authors argue that a more dynamic domestic and external aggregate demand helps to raise the inflation rate, easing the constraint deriving from the zero lower bound and allowing monetary policy to depart from its current ultra-accommodative position. Beyond macroeconomic factors, the book also discusses a supportive financial environment as a precondition for the rebound of global economic activity, stressing that understanding capital flows is a prerequisite for economic-policy decisions.
